ABSTRACT

The planet earth is the motherland of trillions of living beings. Each and every living being has the right to live on the planet. Food is the fundamental need of any living being to survive and all living beings on the earth planet are sustaining on their own food chain system. Increase or decrease of even a single living being can affect the whole food chain system. The beauty of food chain system is disturbing due to the rapid increase of human population. The modern agriculture system which the human beings are practicing with the intention of increase the food production to overcome the starvation is destroying the ecological system. Increased use of chemical fertilisers and pesticides are polluting the natural resources. Indigenous seeds are disappearing and high yield varieties of seeds are occupying the place. The input cost in agriculture is increased due to the import of high yield seeds, chemical fertilisers and pesticides and wide use of machinery. The increased input cost and non-profitability in modern agricultural system brought the farmer to the centre of vicious circle. Slowly but gradually multinational companies are achieving the hold on agriculture sector. In the name of survive human being destroying the whole ecological system. This paper attempts to examine the impact of modern agriculture system.
